

Dynamic Consulting System (DCS) **Dynamic Consulting System is created and performed by Dimnet in order to expand the possibilities of consulting offerings to customers.**

DCS has been researching the possibility of expanding the consulting market into the internet world. This world is open to endless possibilities, where the consultants should take advantage of this opportunity today as it is yet to be explored by others. The goal of DCS, primarily, is for political consultants to deliver the possibility of offering their propositions to their customers on the Internet. At the same time, you will be able to give and receive more information to ultimately generate dynamic feedback between the client and the company, using this as if it were an informative data processing field. This will also ensure a closer and more reliable link between sensors and analysts regarding the public opinion of their source.

The dynamic methodology makes everything all the more possible and you are also able to change the public opinion through the gatherings/associations of the consultants in a quick and reliable manner.

What can DCS offer?

In an increasingly globalized world and an increasingly competitive market, where communications are developing at a tremendous pace, the consultants have reached their limit. However, they have not found the necessary technology to capture the public opinion through new means of expression, which has been generated by the endless world of the Internet.

Also, they have found their limit in time to make themselves known and express the analysis that they have obtained in this world that extended its presence to a new era of communication.

In other words, the widening of communication margins in today's world brought about by the internet is not covered by public opinion consultants and political analysis. The main tools used today to collect data or information comes from surveys and telephone surveys.

The proposal we bring with DCS is to generate a new complementary channel to gather information that covers the hole mentioned earlier.

System Dynamics Consulting consists of two main areas: the first is to obtain information in an area that has so far been unexplored, as mentioned before. And the second area aims to create a close link between the consultants that incorporate the system and the people. In order to receive information we include the dynamic possibility to create online surveys and also the possibility to set up and manage a website for the client. In it, the client will be able to set up the way they want to carry out their activities in order to deliver and gather information of a great part of the population.

When we propose to establish a link between the consultant and the people, we intend to deliver the tools needed for this. Since nowadays the consultants are closer to the people, who obtained the data, which is extremely close and connected to the media.

For any work tools are needed, the more modern and agile the better. Therefore, we are approaching a series of resources including: dynamic surveys, effective web pages (for both the consultant and the client) and newsletters (both informative and consultive). Through this, people can interact with the consultancy delivering information and consulting data that is obtained in different measurements.

We hold, for example, people who participated in a survey whether personally or over the phone, you can ask for their email and from there start the link to notify the company and make it known, and as mentioned before to gather information.
